In Class Assignment:

Complete the functions used in jsDom.html

jsDom.html has 3 buttons. Each calls a JavaScript function that needs to be implemented. Implement each function as so:

depositChecking – this function should increase the checking balance by $100. To do this, you'll need to get the current value stored in the <td> element of the table holding the checking balance. Add an id to that <td> element and use document.getElementById to get the value. Increase the value by 100 and replace the value with the new one.

depositSavings – this function is similar to depositChecking, but changes the savings balance.

emptySavings – this should empty the savings by changing the balance to 0. The <h4>Bank Accounts header should be changed to "Alert: Savings Empty". The <h4> heading should go back to "Bank Accounts" after money has been deposited in the savings account again.
